What Is Photoshop? Photoshop uses a raster (pixel) system that creates, manipulates, and edits images, as opposed to using a vector system such as Illustrator or InDesign. Raster images are stored in layers and used to create complex images. Although Illustrator and InDesign are good for creating vector images, Photoshop enables you to import images that are either raster or vector (in a variety of formats) to create complex images. A layer is used to separate groups of pixels and prevent them from interacting with the background. Layers can include complex images, such as faces, for example. Because Photoshop is such a user-friendly program, there are many options that enable you to learn the basics of image editing with minimal knowledge of using an image editing program.

Snow accumulation The dream snow Blue skies are finally making an appearance with the recent drop in temperatures. However, the real winter is just around the corner. That means that times are getting short as we prepare ourselves for the harsh storm of the season. As spring comes to an end, we need to think of the upcoming months as being as difficult as the winter months. Snow falls, we must transform our homes for winter. The snow leaves its mark on the walls, floors and windows but it's also the cause of all sorts of problems. The fresh surfaces, frost, and/or grime can cause carpet and upholstery stains. These can be removed by applying warm water and a detergent solution and then rinsing. You can use a rug brush to get into the corners of the carpet. The chances of furniture being covered in snow is higher than what you might expect. Bear in mind that even though there are sponges in high quality upholstery products, they can only work on the surface and will not be able to extract stains that lie deep within the material. You may use a vacuum cleaner that has hard-surface attachments to lift any snow or dirt away from upholstery. You can also use a wet cleaning method that uses different kinds of detergents. Depending on the type of upholstery, you may need to treat it with a solution and then allow it to dry. Upholstery cleaning is the best option if you have pets or dirt and stains in the house. Although other cleaning methods may be better, they won't be able to remove everything from the upholstery. Furthermore, having dirty furniture can be a real health hazard. Carefully clean your furniture whenever snow is expected. Make sure that you have plenty of supplies on hand. Make sure you take these things into consideration: Just when you thought it was safe to go back in the water. A Texas woman who visited a hot springs called Arkoma Springs took a photo of herself and her boyfriend while she was standing in a cold pool. "I've never seen it this cold in Arkansas," the man joked as she smiled at him in the photo. "I was going to put some clothes on this pool, but I didn't have any clothes on my body," the woman later told the FOX 4 Defenders. "I'm

Q: Hashtable to List, cannot convert from TKey to Key Why I get following error while trying to convert a hashtable to a list: The best overloaded method match for List.Add(System.Collections.Generic.KeyValuePair)' has some invalid arguments Hashtable data = new Hashtable(); DataRow[] rows = (DataRow[])data.Rows.Add(null); //line error is here List drows = new List(rows); A: data.Rows.Add(null) is equivalent to data.Add(null, null). If you then try to pass this null to the constructor of the List, you get the error message you posted. (Or you wouldn't if you used List.) You can add a default value for the KeyValuePair, as suggested in the comments, like: Hashtable data = new Hashtable(); DataRow[] rows = (DataRow[])data.Rows.Add(default(DataRow[]), null); Or: DataRow[] rows = (DataRow[])data.Rows.Add("", null); Or, if you don't mind creating duplicate keys in the hash table: DataRow[] rows = (DataRow[])data.Rows.Add(null, null); If you do want to be able to add duplicate keys, you can still use: DataRow[] rows = (DataRow[])data.Rows.Add("", null); package com.in28minutes.example.jpa.customer; import javax.persistence.Entity; import javax.persistence.GeneratedValue; import javax.persistence.GenerationType; import javax.persistence.Id; import javax.persistence.Table; @Entity @Table(name = "customer") public class Customer { @Id @GeneratedValue(strategy = GenerationType.IDENTITY) private int id; private String firstName; private String lastName; private String phoneNumber; private String address; public Customer() { } public Customer(String
