As a developer, when you are asked to build a web-application, one of the first questions that you ask yourself is where to host the application. So, in this article we're going to cover the top 5 web hosting options in 2019. We'll also go through which hosting models suit different needs of the developers. If you want to launch a simple blog, eCommerce store, or some other kind of SaaS, you're probably gonna use a shared hosting solution. This is a web hosting type with a one-size-fits-all approach. You have a single hosting package, and you get the whole system. But this approach comes with a downside – the prices are usually quite high. If you want to run a web application where you have the need for performance, this is the hosting model that you want. You have dedicated hosting, as the name suggests. These are web servers where you are the only user, and the servers are yours alone. Dedicated hosting is the one that gives you the most freedom. You have full control over the web hosting. You get the ability to set any kind of server software that you want. However, this type of hosting is more expensive. However, the numbers might help you decide for yourself. If you are a developer who enjoys creating and developing different web applications, you need to know what kind of hosting environment you are going to use. The first approach is pretty much like a shared hosting. You get a single server, and you are responsible for the whole platform. The second approach allows you to have more control over what you are doing. Your chosen provider manages the setup and is the one that tells you the tools and applications that you need and what is available for you to use. You

will not have direct access to the platform, but the provider will be helping you to get going. Before you make your choice, try to find out if there are any advantages for using one of these models. You can try to build a comparison table, and make yourself an educated decision. You don't have to install all your hosting tools and software

Focus on the applications your users need to do their job. Many business executives are familiar with building a truly mobile enterprise. With
