wedge products of rank 2 matrices In my physics textbook I found that all the maximal dimension  $n$  linear subspaces of the space of  $n \times n$  matrices are contained in the semilinear subspace  $T_{n-2} \subset M_{n \times n}$  Here  $T_{n-2}$  are the orthogonal projectors on the subspace of matrices of rank at most  $n-2$  and we are taking  $n \geq 3$ . Does it imply that there is no other such subspace? i.e. is it true that any maximal dimension subspace of the space of  $n \times n$  matrices contains subspace  $T_{n-2}$ ? A: If you mean maximal dimension subspace in  $M_{n,n}$ , the answer is YES! Every maximal dimension subspace of  $M_{n,n}$  contains a subspace isomorphic to  $T_{n-2}$  (for your  $n$  we get  $T_{n-2}$  with dimensions  $2$  of the upper left square and  $n-2$  of the other  $n-2$  entries)

Giant pulmonary arteriovenous malformations. Pulmonary arteriovenous malformations are uncommon lesions but may be of considerable size; a review of the literature reveals few reports of giant pulmonary arteriovenous malformations. The authors report seven cases of giant pulmonary arteriovenous malformations that were detected by screening computed

---

tomographic (CT) scans of the chest. Four patients had no other associated abnormalities, and five patients had previous pulmonary embolism. Patients ranged in age from 4 to 65 years; the male-female ratio was 2:1. Five cases were asymptomatic; one had an acute upper gastrointestinal bleed. One patient with a giant pulmonary arteriovenous malformation died of secondary pulmonary hypertension. There were no false-positive CT findings with this technique. Screening CT of the chest should be performed to evaluate patients with recurrent pulmonary
