What's New In Portable Hard Disk Sentinel Professional?

The program is a complete solution for the monitoring and analysis of hard drives. Designed for disk makers, it is a fully-featured tool that assists them in the manufacturing process as well as in disk troubleshooting. It can measure various aspects of drives, including temperature, surface, S.M.A.R.T., information, physical and logical attributes and much more. P.H.D.S. helps collect and interpret all of this data into three reports: on-line, where you will have access to a live interactive viewing and analysis of the disk; off-line, where you can export all of the data from the on-line reports into a single file; and off-line export, where you can create a large file containing all of the data from the on-line and off-line reports. In addition to collecting data about the disk, you can get information about the drive's entire system. P.H.D.S. detects incompatible hardware as well as incompletely seated drive heads and guides you through the installation of the missing components. You can eliminate glitches, delays or stuttering by optimizing the hardware, adjusting its BIOS settings or creating static and security passwords. Some of the most frequently asked features are: - monitoring temperature; - recording time, temperature and drive position; - analyzing S.M.A.R.T. attributes; - and examining surface and drive quality. In addition, P.H.D.S. is able to provide a thorough analysis of NTFS and FAT32 partitions. It does this by testing the files using the MBR and DOS BOOT.SYS utilities. P.H.D.S. can handle any type of hard disk. It is able to detect the manufacturer and model, as well as the

serial number and interface. P.H.D.S. can perform tests in five different ways: - diagnostics; - surface test; - lock diagnostics; - custom test; and - hardware tests. The application can display information in various categories: details, attributes, time, temperature, special information, locks, volume information, report, version and options. You can set up alerts and customize them for problems and failures. Depending on your needs, these can be set up to trigger a sound, email, the display of a warning or the performance of a custom script. You can also view, in real time, all disk operations and errors. This comes handy
