blue is a music composition environment that integrates a practical sound synthesis program with a track editor and a container for music notation. Usage Use blue to develop music pieces where you usually need both the audio- and the notation-interface. Blue features a strong sound interface and an efficient container for musical notation. Try to use blue for development of more complex music pieces, since a track editor with sufficient editing functions are essential for composition. Installation Download blue and extract it: $ tar -zxvf blue.tar.gz Copy blue to your home directory (for instance, $HOME/blue) and run blue. A: Have you checked this out: Based on your description of "Must be developed in Java", I assume that this is the kind of app you're looking for. Brooks Inc. has been a premier manufacturer of seat belts for automobiles for over 50 years. Based in South San Francisco, Brooks is a major subsidiary of National Automotive Brands and has been producing seat belts under the Brooks, Lear, Warn, Flex-Reloader, and a few others brands for more than 60 years. Customer Rating: Brooks says seat belts are designed to protect the occupant and/or driver and all their passengers during a vehicle crash. The belt tightly wraps around the occupant and is then tightened using a locking mechanism to provide restraint to the occupant. Seat belts are not only designed to keep the occupant in place during a crash, they are designed to pull the occupant away from the windshield in the event of a crash if they are properly restrained and if the seat belt is properly fastened. By preventing the occupant from being thrown against the windshield and allowing them time to actuate an airbag or personal protection device, seat belts provide better protection to vehicle occupants. In addition, seat belts help reduce injuries and deaths during crashes. Flexible seat belts, like those produced by Brooks, have been shown to significantly reduce a vehicle's kinetic energy on the occupant and the occupant's injuries in crashes. By adding a tensile force to the vehicle when wearing a properly fastened seat belt, the flexible belt reduces the occupant's forward movement and violent deceleration in a collision. Buckle Type and Belts There are a variety of belt types that are used on vehicles, including: Type of belt: The type of

blue is written as a complement to csound, the program was created to create a environment that is similar to multitrack, but to use timelines within timelines. I have been using blue a little over a year now. When I first started using blue I did not need a performance application and so the timing that

the audio was streamed through was not important to me. My idea was that as a music composition environment it was important to allow for a more flexible timeline. I later found csound to have enough tools and dynamics to suit my needs as I think the world of Blue. - Blue has many uses, a simple one is for composers to create score drafts. Another nice thing about blue is that it is the result of a Java 1.4 implementation of the FTL(Fundamental Transduction Layer) project (which is a rather old one). I also know that there are people out there who use Blue and believe that it has a future. I think that it has a bright future. - Blue has no connection to the development of Java and so it is open source. - Blue has been in development by the brains of Larry Korn (larry.korn@sun.com) and myself (chris.cochrane@sun.com). Also, we have helped with this project to expand the features and abilities of the program. I believe that the future of blue is wide open, it is in the hands of users and we will move it where it needs to go. Regards: Chris Cochrane jim@sibelius.com I was called ccochrane back when I was known as the acronym guy. Csound was developed by Ken Shirriff, Efoutas, and myself (j.p.mccartney). It is now in its 12th year and is still going strong, I would suggest that you check it out. The FTL guys are still around (Lk, Larry, martin, bk) if you need any help. Timelines are used to organise your material. If you have an audio CD with 4 tracks of music on it, the first track is on the first timeline, the second track on the second, the third on the third timeline and the fourth on the fourth. Each timeline has a number of places on it. After the main timeline and place settings are created, you can create as many place settings as you want on each timeline. Each place setting can have a specific sequence of 8 different sounds. As a user, you will be able to organise material by adding it to timelines. When it comes to mixing, you can mix and save sections of the material in each timeline. This means that you can download a section of material and have it saved as you go back to your composing. blue is the combination of the following technologies: Java MIDI The Csound system The CMU-PD stack Does anyone know of a self-standing version of blue? A: There isn't a standard version of Blue outside of the University of California at Berkeley, the main developers. You could install the Blue package from that university and the Blue documentation (and of course, the Csound manuals) from here. I will not list many of the available Blue documents, as they are all on the Blue site. The main documentation site is here.

The elastic sheets or web material are obtained by vulcanizing and shaping a flat blank of vulcanized rubber which is deposited on a metallic support. This vulcanization is done in an autoclave under pressure with steam (see U.S. Pat. No. 3,405,052 for example). U.S. Pat. No. 3,795,416 discloses a process and a plant for the vulcanization of rubber in an autoclave in which the steam supply is adjusted to a minimum at constant pressure during operation. The vulcanization (crosslinking) of the rubber requires the use of a vulcanizing agent (crosslinking catalyst, vulcanization accelerator, etc.) which serves to accelerate the reaction
