The name AutoCAD (“AUTO” in the original version) is a portmanteau of the words automatic and computer-aided. In the beginning AutoCAD supported the task of creating topologically accurate drawings by using predefined commands, without the need to know the technical details of the underlying program. Due to this feature, AutoCAD could be used by virtually any professional who had some knowledge of topology and drafting. Typical computer-aided drafting (CAD) programs consist of three main parts: .a vector graphics display (Canvas) .a digital front end for the creation of geometrical objects. (Editor) .a specification system (Description) The interface between the two parts is standardized: the Canvas is an application that displays objects and their coordinates in 2D space, while the Editor is an application that displays geometrical information and describes the objects, or makes changes to the objects (by moving, rotating, scaling, and modifying their properties). The two programs communicate through the Specification, which describes the geometry (and some of its properties) that is being edited. The specification is processed by the specification engine, which determines the location of the Geometric Objects (GOs) within the Canvas and the properties of those objects, based on the specifications provided by the specification. The Specification The Specification (or Geometry) of an object is, as the name implies, a description of the object and its properties. The Specification contains all the properties of an object, such as its name, dimensions, color, material, style and so on. This information is used in the Editor to determine the position and size of the objects on the Canvas. The Specification is stored as a set of symbols (also known as tags). Each symbol has a name and a value (a number or a string) associated with it. The name is the text that appears in the symbol list box and the value is the information that the symbol provides. In AutoCAD a new type of symbols is available: symbols for AutoLISP functions. This type of symbol is used to build AutoCAD’s topology engine, which determines the topology (topology is the term used for the arrangement of the object’s surfaces, edges and vertices) of the object being edited. Symbols for AutoLISP functions can also be

Smart Graphics options Smart Graphics is a feature in AutoCAD that allows you to configure AutoCAD to work with objects the way you work with them. It is important to understand that you should not let your engineering or drafting skills override the way AutoCAD works. It is also important to understand that the list of operations on objects available through Smart Graphics is as broad as an engineer or draftsman might expect. The following are some of the most commonly used Smart Graphics operations. Figure 2.16 Smart Graphics-Configure. Smart Graphics-Configure (see Figure 2.16) is used to configure basic Smart Graphics for most objects in AutoCAD. This tool allows you to select an object or set of objects and then press one of the buttons below the configuration list to apply the corresponding Smart Graphics operation to the selected objects. Some of the most commonly used Smart Graphics operations are: • Select which dimensions should be included in AutoCAD’s dimension snap. • Configure an option for prompting you for a current dimension. • Hide existing (or move it to another part of the screen). • Enable or disable a visible frame. • Select a default tool and a desired layout. ca3bfb1094
