Understanding the relationship of layers and channels Although a _layer_ is a fundamental concept in Photoshop, it's also important to understand the relationship of layers and channels. Layers are used to make editing easier and more flexible because you can alter one layer or the entire image, instead of having to work on individual pixels. (It's obvious that if you can change a layer, you can manipulate individual pixels if you want.) You can create layers in the following ways: * You can create a new layer by pressing the Enter (Return) key or clicking

50 Pounds of Garlic When I was a little girl, I remember going with my mother to the supermarket, and standing in the produce section (say it with me, "Produce section") selecting my favorite fruits and vegetables. One of my favorites to purchase was crates full of fresh, unpeeled, green, summer squash. That was another thing that summer squash brought me — satisfaction. I remember pulling those big, heavy bales from the store and noticing how heavy they were. Heavy in a good way. That squash would sit on the counter for days. I'd lop off pieces and arrange them in a mound in my refrigerator. I'd slice pieces off, dice them, and place them in the freezer. One Saturday, my mother and I went to the market. She was looking for something for dinner — and I wasn't going to miss out. There were several crates of sliced summer squash, perfectly ripe, ready for picking. I grabbed one. "Whoa, what are you doing?" she asked as I ran to the cashier. "I'm getting some squash." "For how many?" "Oh, five or six." "Six?" she exclaimed. "Yep." I smiled, as I handed the cashier the cash and took my squash back to the car. It probably wasn't a big deal to her, but I remember thinking I was so, so happy about the pickled, frozen, unpeeled greenness filling my freezer. And yet it was. I had my own personal frozen batch of summer squash to enjoy with rib-sticking ribs, and garlic mashed potatoes. And a few hours later, I was having a great big plate of them. I loved every bite and could look forward to them with satisfaction. On other days, I would bake a pie with the squash. I'd bake my own, or I'd buy piecrusts and some sweetened condensed milk to fill them with. I don't know how I got onto a kick of making squash myself — but I soon found myself mixing in other ingredients: black beans, curry powder, a can of diced tomatoes, cayenne pepper, olive oil, and of course garlic. I was in love.

How to migrate from AWS to GCP AI/ML is still generally deployed on-premise using on-premise resource. However, we all know that some of AI/ML users are moving to the cloud to deploy their AI/ML. AWS is widely used and has many suppliers for AI/ML service. However, GCP is Google's cloud AI/ML platform. As Google has far more resources than AWS, they have developed their own AI/ML platform, which features a level of intelligence far beyond anything AWS could provide. Here we will introduce how to migrate your AI/ML services to Google Cloud Platform. In order to migrate from AWS to GCP, you need to follow the steps below: Install Eclipse IDE Install JDK8 Clone a GCP-specific version of OpenAI's Caffe2, Hub5 Create an account on Google Cloud Download the Google Cloud Platform (GCP) SDK Download the Caffe2 Git Repository Set up Kubernetes Create a Virtual Machine for running Caffe2 Download and Install a Cloud-based version of Caffe2 Create a GCP project Set up GCE-based Caffe2 cluster Deploy a Caffe2 Model in GCP Publish a Caffe2 Model to GCE That's all. Now you can deploy your model in GCP. Create a Google Cloud Platform (GCP) account GCP provides two major cloud platforms, which are Compute and Storage. Storage provides a way to store data in a cloud environment. At the end, you will use the GCP to store both training and inference data. To set up GCP, you must create an account. Visit Google Cloud to create your account. Clone a GCP-specific version of OpenAI's Caffe2, Hub5 Google's Caffe2 was released in June 2019. In order to build Caffe2 in GCP, it is necessary to clone the repository. You can copy the Caffe2 source code from and paste it into your local directory, which is subsequently exported to a repository. This repository contains a GCP-specific version of Caffe2 Hub5, as well as pre-
