LISP LISP is the acronym for "Lisp" or "List Processor". LISP is a computer programming language designed in the 1960s by John McCarthy and implemented in many systems, like the ALGOL W language. The popularity of LISP is at least partially attributed to the fact that it was one of the first programming languages that was not based on the use of a computer language from the procedural or object-oriented paradigm. LISP is an example of an imperative programming language. LISP is similar to BASIC in that the programmer provides an initial set of instructions for execution, and when called upon, the program does its own processing and generates its own instructions and may display graphics or move data from one place to another. AutoCAD supports a programming language called AutoLISP. It is a part of the object-oriented API called ObjectARX. AutoLISP supports a number of programming paradigms, including object-oriented, function-based, and imperative. It also supports procedures. It is a dynamic (i.e. the code changes) programming language. AutoLISP is written in Lisp dialect and is therefore a high-level programming language. The name AutoLISP comes from the fact that it is based on the AutoLISP programming language. The syntax of AutoLISP is quite similar to Common Lisp. One of the more notable differences is that in AutoLISP, the format of a program is written in the same format as the output. Autodesk Exchange Apps In 2015 Autodesk Exchange Apps was launched.
